Abstract

This report represents the results of an archaeological evaluation undertaken by AOC Archaeology Group as part of a phased programme of archaeological works at East Beechwood Farm, Inverness, Highland. The evaluation was commissioned by Highlands & Islands Enterprise. The works consisted of an 8% intrusive evaluation with trenching amounting to a total of some 16,400 m².

The work was carried out in October 2010 and was conducted according to the terms of a *Written Scheme of Investigation* (AOC 2010) which was agreed by HCAU.

The evaluation revealed numerous features of archaeological significance including curvilinear ditches and a variety of pit and post-hole features. Artefacts recovered included a single flint flake and prehistoric pottery sherds. The archaeological data is suggestive of Bronze Age / Iron Age later prehistoric settlement comprising ditched enclosures and timber post-built structures.

As required by HCAU, a mitigation strategy to deal with these findings will be prepared compliant with Scottish Planning Policy (2010) and Pan 42 (1994).

1 INTRODUCTION

1.1 Development Background

1.1.1 A programme of archaeological works was required by Tuner & Townsend on behalf of Highlands & Islands Enterprise in respect to a proposed mixed development at East Beechwood, Inverness. The development area consists of a greenfield site covering approximately 28 ha lying within the administrative area of Highland Council, which is advised on archaeological matters by Highland Council Archaeology Unit (HCAU). The scope and scale of the archaeological works, in keeping with the policies outlined in Scottish Planning Policy (February 2010) and Planning Advice Note 42 (1994), were determined by HCAU (*Specification* dated 2nd March 2010). This work was designed to assess the extent and significance of any archaeological remains which may be present within the development area.

1.1.2 An assessment of the site's archaeological potential requires a phased response. This was to consist of:

Phase 1 the undertaking of geophysical survey and an intrusive archaeological evaluation (trial trenching) based on a maximum 8% sample size. This work was designed to determine the nature, extent, condition, date and significance of any archaeological remains within the proposed site area;

Phase 2 the provision of a evaluation data structure report detailing the findings of Phase 1. Should significant archaeological deposits be discovered, a mitigation strategy will be prepared compliant with *Scottish Planning Policy* (2010) and *Planning Advice Note 42* (1994);

Phase 3 given the discovery of significant archaeological material where preservation *in situ* proves infeasible the undertaking of a programme of archaeological mitigation works as defined in a further Written Scheme of Investigation approved by Highland Council.

1.1.3 An early phase of evaluation (AOC 2009) was undertaken in January 2009. This work focused on two areas amounting to just over 7 ha in the north and south-west of the overall development area. The results of this work are summarised below (see section 1.4.1).

1.1.4 A programme of historic building recording, a Level 2 historic building survey on Beechwood Farm (NMRS NH64SE232), ran concurrently with the evaluation. This work will be subject to a separate report.

1.2 Site Location

1.2.1 The evaluation area lies within East Beechwood Farm, Inverness, Highland (centred NH 6909 4518; Figure 1). The A9 road lies to the west of the development area with a railway to the north-east and open ground to the south. The current land-use is a mixture of arable and silage fields crossed by a burn running east to west across the development site. The area investigated amounted to some 22 ha.

1.3 Archaeological Background

1.3.1 The proposed development area has provided extensive evidence of prehistoric activities. Three burnt mounds (MHG29238 & *NMRS* NH64NE 625) as well as cropmarks indicating pit circles (MHG3683, Scheduled Ancient Monument 11535) and a ring ditch (MHG3740, Scheduled Ancient Monument 11535) have been identified within the proposed development area. Additionally flakes and scrapers (MHG3674) have been recovered from within the developments boundaries. A further set of cropmarks including a linear feature, a pit and a pit circle (MHG3059) are located on the western boundary of the site (AOC 2008).

The extensiveness of the prehistoric settlement in the area is further indicated by identification of several sites within the 500 metres of development area. These include seven ring ditches (MHG24763, *NMRS* NH64NE40), ring groove roundhouses (*NMRS* NH64NE 15), an enclosure, a pit alignment, Bronze Age cemetery and large sub-circular feature (*NMRS* NH64NE40), a possible borrow and enclosure (*NMRS* NH74NW 112), a cairn (*NMRS* NH54NE 6), several microliths and pits (*NMRS* NH64SE 246 & *NMRS* NH74NW 114) and flint scrapers and cores (*NMRS* NH64SE 47 & *NMRS* NH64NE 106). Raigmore Cairn (*NMRS* NH64SE 47) was originally located east of the proposed development area. Further hut circles may also have lain just south-east of the proposed development area (*NMRS* NH74SW 12). Additionally an enclosure at Castlehill (*NMRS* NH64SE 2408) and a linear feature at Raigmore (*NMRS* NH64SE 60) may also be of prehistoric date (ibid).

1.3.2 Cartographic evidence has indicated that the site has been in agricultural use throughout the post-medieval and modern periods. A new farmhouse was constructed at Beechwood in 1904 and small settlement clusters in the surrounding area developed during the latter half of the 20th century. Inverness has rapidly expanded east towards the site during the last 50 years (ibid).

1.4 Prior evaluation works

1.4.1 *2009 Evaluation trenching*

In January 2009 an archaeological evaluation (the first stage of evaluation of the East Beechwood development area) was undertaken on two land parcels lying to the north (NGR: NH 6894 4538) and south-west (NGR: NH 6913 4463) of the current evaluation area. This work revealed features of archaeological significance within the northern land parcel (the area to the south-west proving archaeologically sterile) including several linear ditches of unknown date, a large enclosure ditch and terminus of probable prehistoric date and a variety of pit and post-hole features. Artefacts recovered from the pit features included a single flint flake and prehistoric pottery sherds including Neolithic Grooved Ware. A large quantity of impressed daub was revealed within the ditch terminus (AOC 2009).

The 2009 evaluation indicated that significant archaeological features survived on higher ground with the clusters of post-hole features and ditch are suggesting Late Bronze Age / Iron Age settlement comprising a ditched enclosure and timber post-built structures. However the presence of Grooved Ware may denote on-site Neolithic activity dating to the end of the fourth Millennium BC based on evidence from the nearby site at Milton of Leys (MacSween 2003). The

presence of phased archaeology, as illustrated by the inter-cutting of features, and the multi-period archaeological landscape evidenced by sites in the immediately surrounding area suggests the evidence unearthed by the evaluation probably represents a palimpsest of individual or suites of features of different periods.

1.4.2 2010 Geophysical Survey

A geophysical survey (3 ha of fluxgate gradiometry) of the development area undertaken in August 2010 was heavily constrained by standing crops (ASDU 2010). The survey proved inconclusive with a few very weak anomalies possibly reflecting the presence of shallow ditches. Elsewhere more intense anomalies could suggest burnt materials. Crucially, the inability to carry out the full 40% geophysical survey sample (8 ha) led to the requirement for an 8% evaluation trenching sample rather than the original 5% sample deemed necessary in the *specification* for the evaluation works prepared by HCAU.

2 OBJECTIVES

2.1 The objectives of the archaeological works were:

- i) to assess the character, condition, extent, quality, date and significance of any as yet undiscovered archaeological remains within the proposed evaluation areas;
- ii) should significant archaeological features/deposits be discovered to prepare and implement an appropriate mitigation strategy compliant with *Scottish Planning Policy* (February 2010) and *Planning Advice Note 42* (1994).

3 METHOD

4.2.1 The evaluation was achieved through the excavation of linear and box trenches using mechanical excavators (tracked 360s) equipped with a 2 m wide ditching buckets. The trenching will covered an 8% sample of the available development area (Figure 1). Trenching was determined by the following factors:

- geophysical anomalies;
- the presence of known former archaeological features;
- random distribution;
- the presence of possible sediment traps;
- topographic advantage.

4.2.2 The trial trenching aimed to establish the extent, condition, character, quality, significance and date of any archaeological features present. Trenches, square and linear, were of varying lengths and sizes and set on varying orientations. Excavation was in shallow units/spits until the first significant archaeological horizon or natural drift geology was reached. All machine excavation was supervised by an experienced field archaeologist.

4. RESULTS

4.1 Introduction

4.1.1 The archaeological evaluation was undertaken between 4th and 22nd October 2010 and consisted of 65 linear trenches and 36 (ten metre square) box trenches. This gave a combined basal area of 16,400 m² (Figure 2). Field 3 was unable to be evaluated at this time as unmarked slurry pits and septic tanks were present. Overall weather conditions were generally fair and good archaeological visibility was present throughout the entire evaluation. The following should be read in conjunction with the data presented in Appendices 1-6, Figures 1-15 and Plates 1-7.

4.1.2 The excavation of the trenches revealed topsoil comprised of soft, mid/light brown silty sand with numerous small sub-rounded and sub-angular stones. The topsoil was of greater than anticipated depth ranging from 0.50 m to 0.80 m. Small amounts of modern white ceramic and glass were observed scattered throughout the topsoil in all of the trenches. Underlying the topsoil, a light brown sandy 'B' horizon (ranged from 0.10 m to 0.70 m depth in pockets) was present in the fields north of the farm access road. The natural subsoil consisted of sands and gravels with occasional spreads of boulder clay. Small patches of manganese were encountered in several of the trenches. Numerous medium sized sub-rounded and sub-angular stones were present in the subsoil.

4.1.3 Field drains were encountered within the majority of the trenches and consisted of both rubble and tile types. The drains ran approximately from north-west to south-east and from north-east to south-west. Several hand dug slots were excavated through these drains within each trench.

4.1.4 A moderate number of natural stone-holes caused by the displacement of boulders by agricultural activity were also present. This was unsurprising given the nature of the subsoil. All but the most obvious were initially treated as features and investigated.

4.2 Archaeological Features

4.2.1 The trial trenching revealed numerous archaeological features, generally observed in relatively loose concentrations, these were located within Fields 1, 2, 6 and 9. Fields 4, 7, 8 and the single trench (Trench 90) in Field 11 were archaeologically sterile (Figure 1).

4.3 Field 1 (Trenches 63, 64, 65, and 67)

4.3.1 *Trench 63 [6301] [6303] [6305], [6307] & [6309] (Figure 13; Plate 1)*

Trench 63 was excavated along the boundary of the disused farm track abutting the A9. Thirteen archaeological features were identified, consisting of pits and post-holes and a single Linear [6307]; five features were excavated [6301], [6303], [6305], [6307] & [6309]. Pit features [6301] and [6305] were oval in shape with moderate to steeply sloping sides and rounded bases. Their dimensions were 0.60 m by 1.0 m and 0.80 m by 0.60 m respectively, with depths reaching 0.26 m and 0.35 m. Both were filled with medium brown sandy silt with gravel inclusions (6302) & (6306). Two probable post-hole features [6303] & [6309] were also excavated. Post-hole [6303] was 0.60 m in diameter and had a substantial depth of 0.50. The feature was filled by medium red/brown sandy silt (6304). Post-hole [6309] was excavated

within the terminus of the linear feature [6307], this was 0.35 m in diameter and 0.33 m in depth. The feature was filled by dark brown sandy silt again containing gravel inclusions (6310). Linear feature (or elongated pit) [6307] emerged from the southern edge of the trench and was aligned north-west to south-east. It was visible for 2.30 m and ended in a rounded terminus. The feature had steeply sloping sides and a rounded base. The feature was 1.0 m in width and had a maximum depth of 0.13 m. Within the terminus was the circular post-hole [6309].

4.3.2 *Trench 64 [6401] (Figure 14)*

A single pit feature was recorded within Trench 64. This was an oval cut feature [6401] with gently sloping sides and rounded base. The feature was 2.10 m by 1 m and had a depth of 0.23 m. A fill of medium red/brown silt was present.

4.3.3 *Trench 65 [6501] (Figure 14)*

A single truncated pit feature of probable prehistoric date was also recorded within Trench 65. This was a circular cut feature with sharp, steeply sloping sides and irregular flat base. The feature was 0.70 m in diameter and was 0.14 m in depth.

4.3.4 *Trench 67 [6701] (Figure 13)*

Trench 67 produced a single oval pit feature [6701] located at the western end of the trench. The feature had steeply sloping sides and a gently rounded base. The feature measured 0.80 m by 0.50 and had a depth of 0.32 m.

Plate 1: Post-hole [6303] within terminus of Linear [6307]

4.4 **Field 2 (Trenches 26, 27, 28, 32, 34, 35, 36, 40, 41, 52, 56, 57, 60, 61, 62 & 101)**

4.4.1 *Trench 26 [2601], [2604] & [2606] (Figure 4)*

Trench 26 produced five features including the unexcavated curvilinear feature [2610] and post-hole [2608]. Two pit features [2601] & [2604] were excavated. These features had moderately sloping sides and gently rounded bases. Pit [2601] was a large oval cut feature partially lying under the north facing trench edge. It was 1.80 m by 2 m in size and had a depth 0.40 m. The feature contained two fills of dark red brown (2602) and dark brown sandy silt (2603). The latter of which consisted of <40%

periwinkle shells. Pit feature [2604] was also oval in shape measuring 1.40 m by 0.60 m with a depth of 0.20 m. This was again filled by medium brown sandy silt (2605). Linear [2606] probably represents a large pit, or enclosure or boundary ditch and had moderately sloping sides and an uneven base. It was visible for 1.40 m and was 1 m in width with a depth of 0.37 m (max).

4.4.2 *Trench 27 [2701], [2703], [2705], (Figure 4; Plate 2)*

Trench 27 consisted of five large pit features of which [2707] and [2709] remained unexcavated. Pit [2701] was oval in plan with steeply sloping sides and a rounded base. The feature was partially under the northern trench edge and had visible dimensions of 0.80 m by 1 m by 0.37 m deep. Pits [2703] and [2705] were larger in plan with dimensions of 1.2 m by 2.5 m and 2.25 m by 1.80 m respectively. Pit [2703] had gently sloping sides and a broad flat base. It was also fairly shallow with a maximum depth of 0.20 m. Pit [2705] had almost vertical sides and a flat base, with a depth of 0.40 m. Fills in all of the features were medium grey/brown sandy silt with the exception of Pit [2703], here the fill (2704) appeared darker and more organic. This deposit produced a flint blade (SF 4).

Plate 2: East Facing Section of Pit [2705]

4.4.3 *Trench 28 [2801] (Figure 4)*

Three features were recorded in Trench 28. Post-hole [2805] and rectilinear pit [2803] remained unexcavated. The excavated linear feature [2801] had moderately sloping sides and a rounded base. The feature ran across the trench and was 1.20 m wide and 0.30 m in depth. It was filled by pale grey sandy silt with small gravel inclusions (2802).

4.4.4 *Trench 32 [3201] (Figure 5)*

Trench 32 also provided three features including a further probable unexcavated ditch [3205] and rectilinear pit [3203]. The pit feature [3201] was excavated and revealed a shallow cut 0.20 m in depth, with gently sloping sides and an irregular base. The feature measured 1.3 m by 1.1 m and was filled by dark brown sandy silt (3202) which appeared heavily stained by manganese. It is possible that this feature may be a natural depression.

4.4.5 *Trench 34 [3401] (Figure 5)*

Two features were recorded in this trench. The square cut pit feature [3403] was not excavated. This left the oblong shaped feature [3401], which had vertical sides and a flat base. The feature

measured 0.95 m by 1.20 m and had a depth of 0.35 m. It is probable that both features represent relatively modern activity.

4.4.6 *Trench 35 [3501] (Figure 5)*

Three features were recorded in Trench 35; these included unexcavated post-holes [3503] and [3505]. The excavated feature - linear [3501] - ran across the trench north-east to south-west and had visible dimensions of 3.5 m by 0.60 m and a depth of 0.20 m. Possessing moderately sloping sides, it had an irregular rounded base. The feature was immediately adjacent to post-hole [3503]. All fills appeared to be medium red brown sandy silt.

4.4.7 *Trench 36 [3601] (Figure 5)*

A shallow curvilinear [3601] was excavated in Trench 36. This feature measured 1.0 m by 0.5 m and had a depth of 0.10 m, and had gently sloping sides to a rounded base. Other unexcavated features include two large oval pits [3605] and [3607] and a square (?) pit [3602]. All fills were medium brown sandy silt.

4.4.8 *Trench 40 [4001] (Figure 6)*

Circular pit [4001] was excavated in Trench 40; it measured 0.65 m by 0.70 m in plan with a depth of 0.32 m. The feature had moderately sloping sides and a rounded base. Unexcavated features consisted of two post-holes [4003] and [4005] and a slight curvilinear [4007].

4.4.9 *Trench 41 [4101], [4111] (Figure 6)*

A post-hole [4101] and a pit feature [4111] were excavated within Trench 41. Post-hole [4101] was 0.60 m in diameter with steeply sloping sides and a rounded base. Pit [4111] was oval in plan and measured 0.48 m by 1.10 m. It had a depth of 0.19 m. The pit had moderately sloping sides and a rounded base. The six un-excavated features consisted of a probable narrow ditch feature [4115], and five post-holes [4103], [4105], [4107], [4109] and [4113].

4.4.10 *Trench 52 [5201] (Figure 10; Plate 3)*

This trench contained a curvilinear cut feature with sharp, steeply sloping sides and a flat base. The feature ran from the western trench edge north-east for 8 m ending in a rounded terminus. Two, one metre slots were excavated through the feature showing almost vertical sides and a flat base. The feature was 0.70 m wide with a depth of 0.50 m. The feature was filled with a mixed deposit of re-deposited sands and gravels and pale brown sandy silt. A cylindrical iron object (SF 4) was retrieved from Slot 2.

Plate 3: West-facing section through Curvilinear [5201] Slot 2 showing Iron Object (SF 4) in situ

4.4.11 Trench 56 [5601], [5603] (Figure 10; Plate 4)

Two conjoining curvilinear features were recorded in Trench 56. Feature [5601] ran from the southern trench edge until appearing to join feature [5603]. Two one metre slots were excavated with a feature width ranging from 0.45 m to 0.60 m and a depth ranging from 0.35 m to 0.50 m. Feature [5603] ran from north-east to west and had a width of 0.45 m and a depth of 0.35 m. Both features had sharp, vertically sloping sides and gently rounded bases. The features were filled with identical mixed deposits of re-deposited sands and gravels and pale grey sandy silt (5602), (5604). The features are possibly part of a stock management structure or alternatively they may represent elements of a Pictish *Pitcarmick*-type structure.

Plate 4: Curvilinears [5301] & [5303]

4.4.12 Trench 57 (10 m by 10 m) [5701] (Figure 11) (Plate 5)

A single rectilinear feature was excavated in Trench 57. This feature emerged from and returned within the eastern trench edge. It had sharp vertically sloping sides and a flat base. The feature was 0.55 m wide and was 0.65 m in depth. The fill (5702) was a mixed deposit of re-deposited

natural and pale grey sandy silt. The feature may be part of a possible stock management structure or, potentially, a small example of an Iron Age square barrow.

Plate 5: Curvilinear Feature [5701]

4.4.13 *Trench 60 (10 m by 10 m) [6001] (Figure 11)*

Two oval pits were recorded in Trench 60. The pit [6001] revealed shallow, gently sloping sides and a flat irregular base. The feature was 1.25 m by 0.60 m with a maximum depth of 0.06 m. The unexcavated pit [6003] was larger at 2.25 m by 0.60 m. Both features were filled with pale grey/brown sandy silt (6002) and (6004).

4.4.14 *Trench 61 (10 m by 10 m) [6101] (Figure 12)*

A large circular pit [6101] of probable prehistoric date was excavated in Trench 61. This feature was 1.20 m in diameter and had a depth of 0.10 m. The pit had gently sloping sides and a rounded base. It was filled by dark brown sandy silt (6102).

4.4.15 *Trench 62 (10 m by 10 m) [6201], [6203], [6205], [6207], [6209], [6211], [6213] & [6215] (Figure 12; Plate 6)*

This trench contained a partial prehistoric timber-built round-house structure [6215] which consisted of the post-holes [6203] – [6213]. These were arranged in a semi circle running into the northern trench edge. Two of these features, [6205] and [6209] were excavated revealing steeply sloping sides and narrow rounded bases. The diameter of both features was 0.40 m with depths of 0.30 m and 0.16 m respectively. The unexcavated post-holes were also 0.40 m in diameter. The features were filled with medium grey/brown sandy silt. A possibly associated sub-circular pit feature [6301] was excavated in the south-west of the trench. This feature measured 1.0 m by 0.75 m and was 0.23 m in depth. The pit had two fills the upper deposit (6202) and the primary deposit (6216). The former was mid brown sandy silt which was 0.13 m in depth. This deposit contained four large rim-sherds of prehistoric ceramics (SF 1 & 5). These sherds all appeared to belong to the same vessel. The primary fill (6216) was a sterile pale grey/brown sandy silt with <40% gravel inclusions.

Plate 6: Partial Round-house Structure [6215]

4.4.16 *Trench 101 [10101] (Figure 15)*

A large circular pit [10101] was excavated in Trench 101. This feature was 0.80 m in diameter and remained unexcavated.

4.5 **Field 6 (Trenches 2, 3, 7, 18, 42, 45, 47, 48 & 50)**

4.5.1 *Trench 2 [0201], [0203], [0205], [0207], [0209] & [0211] (Figure 3;Plate 7)*

Trench 2 contained six features consisting of two oval pits [0201] & [0211], two curvilinears [0203] & [0205] and two probable post-holes [0207] & [0209]. Pit [0201] had a 0.90 m diameter with gently sloping sides and a flat base. The feature was cut on its western edge by curvilinear [0203]. This feature extended 1.20 m from the western trench edge and was aligned roughly north to south. It had a width of 0.50 m and a depth of 0.26 m with moderately sloping sides to a narrow rounded base, 0.50 m in wide. The feature may represent a possible late prehistoric ring-groove terminus. Both features were filled with deposits of medium to dark brown sandy silt with occasional charcoal fragments.

Plate 7: North facing Section Pit [0201]

4.5.2 *Trench 3 [0301], [0303], [0305], [0307], [0309], [0311] & [0313] (Figure 3)*

Trench 3 contained seven features including of four oval pits and three probable post-holes. The pit [0301] measured 0.30 m by 1.50 m and had a depth of 0.20 m. It had moderately sloping sides and a flat uneven base. Another probable pit feature [0303] was excavated. This feature had gently sloping sides and rounded base and measured 0.30 m by 0.40 m, with a depth of 0.10 m. Both features were filled with a medium to dark brown sandy silt with gravel inclusions.

4.5.3 *Trench 7 [0701], [0703] (Figure 3)*

Two circular pit features were recorded within Trench 7. Feature [0701] was excavated and revealed steeply sloping sides and a gently rounded base. The pit was 1.10 m by 0.60 m and 0.15 m deep. It was filled with a pale grey brown sandy silt which was found to contain seven sherds of prehistoric ceramic (SF 3) together with charcoal fragments.

4.5.4 *Trench 18 [1801], [1803] (Figure 3)*

Trench 18 contained two circular pit features both of which were excavated. Pit [1801] was a stone lined fire-pit measuring 1.20 by 0.80 m. It had moderately sloping sides and a gently rounded base. The feature was 0.22 m in depth and filled by a deposit of dark brown sandy silt containing <30% fire cracked stone. Pit [1803] was a shallow feature located within the northern trench edge. It was 0.40 m wide, was visible for 0.50 m. A depth of 0.12 m was recorded. The feature was filled by a deposit of orange brown sandy silt with charcoal at approximately 25%.

4.5.5 *Trench 42 [4201], [4203], [4205], [4207] & [4209] (Figure 7)*

Trench 42 contained a large, shallow, circular pit feature [4201] with a diameter of 0.90 m and a depth of 0.10 m. The pit had moderately sloping sides and a flat, irregular base. It was filled with a dark brown sandy silt containing <5% charcoal fragments. Three probable post-holes [4203], [4207] & [4209] were recorded in plan together with an excavated example, post-hole [4211], with diameters of approximately 0.35 m. A further pit feature [4205] was also recorded.

4.5.6 *Trench 45 [4501], [4503] & [4505] (Figure 7)*

Three large, oval pits were recorded in Trench 45. All measured approximately 1.20 m by 0.80 m with the excavated pit [4501] having a depth of 0.10 m. Pit [4501] had gently sloping sides and a flat, irregular base. It was filled with medium brown sandy silt containing charcoal flecks.

4.5.7 *Trench 47 [4701] & [4703] (Figure 8)*

Trench 47 contained an oval fire pit [4701] and a post-hole [4703]. The pit measured 0.90 m by 0.70 m and had a depth of 0.29 m. It had moderately sloping sides and a rounded base. The fill was medium red brown sandy silt which contained small fragments of calcined bone and charcoal fragments. A lens of burnt sand 0.05 m was observed along the base of the pit.

4.5.8 *Trench 48 [4801], [4803], [4805], [4807], [4809], [4811], [4813], [4815] & [4817] (Figure 8)*

Trench 48 contained eight pit/post-hole features and a pit feature [4811]. The pit/post-holes ranged from 0.40 m to 0.65 m in diameter. Features [4801], [4807] & [4815] were excavated showing moderate to steeply sloping sides and rounded bases. The features ranged from 0.20 m to 0.23 m in depth. Fills ranged from a medium to dark sandy silt. No immediately coherent ground plan was formed by this group of features, yet they probably represent the remains of a late prehistoric round-house structure.

4.5.9 *Trench 50 [5001] (Figure 9)*

Trench 50 contained a single shallow feature with steeply sloping sides and an irregular flat base. The feature measured 0.40 m by 0.60 m with a depth of 0.12 m.

4.6 **Field 9 (Trenches 11, 22, 24, 74 & 75)**

4.6.1 *Trench 11 [1101] (Figure 15)*

Trench 11 contained an oval pit feature [1101] and a post-hole [1103] which remained unexcavated. The pit had a gradually sloping western edge with a steeply sloping eastern end and rounded base. The feature measured 1.20 m by 0.50 and was 0.25 m in depth. The pit was filled with a deposit of pale red/brown sandy silt with occasional flecks of charcoal.

4.6.2 *Trench 22 [2201], [2203], [2205] (Figure 15)*

Trench 22 contained three features including two oval pits [2201] & [2203] and an unexcavated post-hole [2205]. Pit [2201] had moderately sloping sides and a rounded base. It measured 1.10 m by 0.50 m and was 0.15 m in depth. The feature was filled by a deposit of medium grey brown sandy silt. The feature was very similar in plan to pits [2203] and [2401].

4.6.3 *Trench 24 [2401] (Figure 15)*

Trench 24 contained a single oval pit feature with a gently sloping eastern edge, an almost vertical sloping western edge and an irregular rounded base. The pit measured 1.10 m by 0.70 m and was 0.23 m in depth. It was filled by a deposit of medium brown sandy silt.

4.6.4 *Trench 74 [7401] (Figure 15)*

Trench 74 contained a single oval pit feature.. The pit had moderately sloping sides and an uneven rounded base. The pit measured 0.75 m by 0.90 m and had a depth of 0.18 m. It was filled by a deposit of pale brown sandy silt which contained small fragments of charcoal.

4.6.5 *Trench 75 [7501], [7503], [7505] (Figure 15)*

Trench 75 contained three large pits of probable prehistoric date of which pit [7501] was excavated. This feature was a circular fire-pit 0.80 m in diameter and 0.10 m in depth. It had

moderately sloping sides and a gently rounded base. The pit was filled with a deposit of dark brown sandy silt of which approximately 70% was charcoal.

4.7 Small Finds

- 4.7.1 Small finds were relatively rare; prehistoric pottery sherds from four contexts, an iron bucket (of unknown date - Andy Heald *pers com*) and a single flint blade (Appendix 5).

5 DISCUSSION

- 5.1 The evaluation indicated that significant archaeological features exist within the area investigated. Identifying the full pattern of the archaeological distribution of non-nucleated groups of features, and their chronology, by evaluation trenching alone can only have limited success. Further archaeological works would be necessary to fully elucidate the archaeology present. However, as with the 2009 evaluation (AOC 2009) undertaken to the north, the clusters of post-hole features and ditches are suggestive of Bronze Age / Iron Age later prehistoric settlement comprising linear / curvilinear ditches (enclosures or field boundaries) and timber post-built structures. The arc of post-holes in Trench 62 typifies one of the later prehistoric timber-built roundhouse traditions.
- 5.2 Large parts of the development site are apparently free of archaeological material. The southern portion of the area investigated including Fields 4, 7 and 8, the access route through Field 11 and the greater southern portion of Field 1 were found to be archaeologically sterile. The land ('Area B' - AOC 2009, 11) to the south and west of Field 4 was found to be similarly free of an archaeological presence in 2009. While it was not possible to subject Field 3 to evaluation trenching it is thought likely, given its location between Fields 1 and 8, that it too is probably archaeologically sterile.
- 5.3 In Fields 12, 9 and the eastern part of Field 6 archaeological features occurred as only as widely detached isolated instances (Trenches 24, 74 & 50) or in small groups in three widely separated locations (Trenches 22 & 75 with 3 features each and Trench 11 with 2 features).
- 5.4 The principal zone of archaeological discovery occurred in Field 2, the north-western part of Field 6 and the north of Field 1. The evaluation trenches and suites of archaeological features (including the 2009 evaluation results) are shown overlain on the major development impacts in Figure 17. The eastern area of Field 2 was, of course, the location of burnt mounds (MHG29238 & NMRS NH64NE 625) which may be contemporary with some of the archaeological features unearthed in Fields 2 and 6. While later prehistoric settlement type features are widely attested in the local area (see above in section 1.3), some chronological depth was recognised in the suite of features identified to the north by the 2009 evaluation (AOC 2009, 12). Likewise non-contemporaneity may be recognised in the present features with a possible small Iron Age square barrow (Trench 57) and potentially Pictish *Pitcarmick*-type features (Trench 56).

6 RECOMMENDATIONS FOR FURTHER WORKS

- 6.1 Given the significant archaeological features and finds recovered during the current evaluation and the 2009 works, it is recommended that a mitigation strategy be prepared compliant with Scottish Planning Policy (2010) and Planning Advice Note 42 (1994). The full scope and scale

of these works would be defined by Highland Council, as advised by HCAU, with the detailed methodology for their undertaking set out in an excavation Written Schemes of Investigation.

END DATE (this season)	22 nd October 2010
PREVIOUS WORK (incl. DES ref.)	Engl RP & Clements V 2009 DES
MAIN (NARRATIVE) DESCRIPTION: (May include information from other fields)	<p>An archaeological evaluation was undertaken prior to a mixed use development at East Beechwood Farm, Inverness. An initial evaluation was carried out on an associated part of the development to the north in 2009.</p> <p>The evaluation indicated that significant archaeological features exist within parts of the development area. As with the 2009 evaluation, clusters of post-hole features and ditches are suggestive of Bronze Age / Iron Age later prehistoric settlement comprising linear / curvilinear ditches (enclosures or field boundaries) and timber post-built structures.</p> <p>A number of the features may be contemporary with the burnt mound NMRS NH64NE 625. Elsewhere lay a possible small square barrow and potentially Pictish <i>Pitcarmick</i>-type features.</p>
PROPOSED FUTURE WORK:	As required by Highland Council Archaeology Unit, a mitigation strategy to deal with these findings will be prepared compliant with Scottish Planning Policy (2010) and Planning Advice Note 42.
